Companies

Suppose an array of length  $n$  sorted in ascending order is **rotated** between  $1$  and  $n$  times. For example, the array `nums = [0,1,2,4,5,6,7]` might become:

- `[4,5,6,7,0,1,2]` if it was rotated  $4$  times.
- `[0,1,2,4,5,6,7]` if it was rotated  $7$  times.

Notice that **rotating** an array `[a[0], a[1], a[2], ..., a[n-1]]`  $1$  time results in the array `[a[n-1], a[0], a[1], a[2], ..., a[n-2]]`.

Given the sorted rotated array `nums` of **unique elements**, return the *minimum element of this array*.

You must write an algorithm that runs in  $O(\log n)$  time.

## Example 1:

**Input:** `nums = [3,4,5,1,2]`

**Output:** `1`

**Explanation:** The original array was `[1,2,3,4,5]` rotated  $3$  times.

## Example 2:

**Input:** `nums = [4,5,6,7,0,1,2]`

**Output:** `0`

**Explanation:** The original array was `[0,1,2,4,5,6,7]` and it was rotated  $4$  times.

## Example 3:

**Input:** `nums = [11,13,15,17]`

**Output:** `11`

**Explanation:** The original array was `[11,13,15,17]` and it was rotated  $4$  times.

## Constraints:

- `n == nums.length`
- `1 <= n <= 5000`
- `-5000 <= nums[i] <= 5000`
- All the integers of `nums` are **unique**.
- `nums` is sorted and rotated between  $1$  and  $n$  times.

Accepted **1.3M**

Submissions **2.7M**

Acceptance Rate **49.0%**

Approach 1:

Linear Scan

$O(n)$

Approach 2:

1/2 line modified binary search

# Using modified binary search

```

1 class Solution {
2 public:
3     int findMin(vector<int>& nums) {
4         int l=0,r=nums.size()-1;
5         while(l<r){
6             int m=(l+r)/2;
7             if(nums[l]<=nums[m]){
8                 if(nums[r]<nums[l]) l=m+1;
9                 else r=m;
10            }
11            else{
12                r=m;
13            }
14        }
15        return nums[l];
16    }
17 };
18

```

$O(\log n)$

means no disturbance in left half

means rotation happened and minimum elements are in the right half.
