

## 209. Minimum Size Subarray Sum

Medium

Topics

Companies

Given an array of positive integers `nums` and a positive integer `target`, return the *minimal length* of a *subarray* whose sum is greater than or equal to `target`. If there is no such subarray, return `0` instead.

Example 1:

**Input:** `target = 7, nums = [2,3,1,2,4,3]`

**Output:** `2`

**Explanation:** The subarray `[4,3]` has the minimal length under the problem constraint.

Example 2:

**Input:** `target = 4, nums = [1,4,4]`

**Output:** `1`

Example 3:

**Input:** `target = 11, nums = [1,1,1,1,1,1,1,1]`

**Output:** `0`

Constraints:

- $1 \leq \text{target} \leq 10^9$
- $1 \leq \text{nums.length} \leq 10^5$
- $1 \leq \text{nums}[i] \leq 10^4$

**Follow up:** If you have figured out the  $O(n)$  solution, try coding another solution of which the time complexity is  $O(n \log(n))$ .

Approach 1: Brute force

$T(n) : O(n^2)$

$S(n) : O(1)$

Approach 2: Using sliding window

→  $l=0, r=0$

→  $l$  is start of window and  $r$  is end of window

→ add  $a_r$  to window

→ if window sum is  $\geq \text{target}$

Then see if inner subarrays of window also has sum  $\geq \text{target}$  by shrinking the window

also has  $sum \geq Target$  by shrinking the window and update answer accordingly.

→ if window sum is less than Target then shrinking the window further also doesn't has  $sum \geq Target$ . So increase the size of window.

$l = 0, r = 0, sum = 0, ans = INT\_MAX$

while ( $r < nums.size()$ )

$sum = sum + nums[r]$

while ( $l < nums.size() \ \&\& \ sum \geq Target$ )

$ans = \min(ans, r - l + 1)$

$sum = sum - nums[l]$

$l++$

}

$r++$

}

return  $ans == INTMAX ? 0 : ans$

Approach 3: binary Search
